Patient Report
For inquiries, contact **1-844-340-1594**

Dear Cologuard patient,

Your Cologuard® result is available. Exact Sciences partnered with your insurance provider to help you get screened for colon cancer.

Your result is **positive**. It's important to remember this may not mean you have cancer. This means you have a higher risk for colon cancer or precancerous polyps right now. Your next step is to have a colonoscopy as soon as possible. Most health plans cover, as part of preventive care and screening, a colonoscopy after a positive Cologuard test result.

Your full result report is included with this letter.

The ordering provider will call you in the next few days to talk about your results, what's next, and answer any questions you have. Since your insurance company requested this test, the health care provider who ordered the test isn't your primary provider.

Here are a few things you can do right now:

Share your result with your health care provider. They can also discuss next steps with you. If you don't have a health care provider, please call the number on the back of your insurance card. Your insurer can help you find a provider in your network.

Complete any follow-up tests or appointments that your health care provider recommends for colon cancer screening.

If you need immediate support, our team is available 24 hours a day, 7 days a week at 1-844-340-1594. You can also visit patient.exactsciences.com to create or log in to your Exact Sciences account to track your order, access your result, and more.

Sincerely,
Exact Sciences Laboratories

Indications and Important Risk Information

The Cologuard test is intended to screen adults 45 and older at average risk for colorectal cancer. Rx only. For indications and important risk information, visit www.Cologuard.com.

	Value	Normal Value
Test Result	Positive (A)	Negative

The Cologuard (TM) test was performed on this specimen.

POSITIVE TEST RESULT. A positive Cologuard result should be followed with a colonoscopy or visual examination of the colon. The normal value (reference range) for this assay is negative.

TEST DESCRIPTION: Composite algorithmic analysis of stool DNA-biomarkers with hemoglobin immunoassay. Quantitative values of individual biomarkers are not reportable and are not associated with individual biomarker result reference ranges. Cologuard is intended for colorectal cancer screening of adults of either sex, 45 years or older, who are at average-risk for colorectal cancer (CRC). Cologuard has been approved for use by the U.S. FDA. The performance of Cologuard was established in a cross sectional study of average-risk adults aged 50-84. Cologuard performance in patients ages 45 to 49 years was estimated by sub-group analysis of near-age groups. Colonoscopies performed for a positive result may find as the most clinically significant lesion: colorectal cancer [4.0%], advanced adenoma (including sessile serrated polyps greater than or equal to 1cm diameter) [20%] or non- advanced adenoma [31%]; or no colorectal neoplasia [45%]. These estimates are derived from a prospective cross-sectional screening study of 10,000 individuals at average risk for colorectal cancer who were screened with both Cologuard and colonoscopy. (Imperiale T. et al, N Engl J Med 2014;370(14):1286-1297.) Cologuard may produce a false negative or false positive result (no colorectal cancer or precancerous polyp present at colonoscopy follow up). A negative Cologuard test result does not guarantee the absence of CRC or advanced adenoma (pre-cancer). The current Cologuard screening interval is every 3 years. (American Cancer Society and U.S. Multi-Society Task Force). Cologuard performance data in a 10,000 patient pivotal study using colonoscopy as the reference method can be accessed at the following location: www.exactlabs.com/results. Additional description of the Cologuard test process, warnings and precautions can be found at www.cologuard.com.
